STUDENT INTERNSHIP ACTIVITY LOG

Intern Name: Faiza Munir

Organization: Masihai PVT LTD

Faculty Supervisor: Sir Waqas Ali

**Reporting Period: (01/06/2025-
31/08/2025)**

Instruction:

1. The student-intern is to fill this form by recording major tasks performed by them.
2. Respective internship supervisors are to review and evaluate the student's activity log.

Weeks	Tasks Performed	Number of Hours
Week #1	• Set up Flutter dev environment and connected to Firebase • Built a small job-application prototype to learn flows. • Created a few shared UI components (buttons, text fields, loaders, colors, typography). • Attended onboarding and team design discussions.	25
Week #2	• Under guidance, understood the feature-based project architecture (/features folder). • Fixed minor UI bugs in the common/widgets, such as button alignment and text formatting on the login screen. • Assisted in testing the appointment booking flow and reported any visual glitches.	30
Week #3	• Connected screens with simple navigation (appointments, settings). • Made lightweight performance tweaks (use const where possible, avoid unnecessary rebuilds). • Fixed a bug in the Appointment History screen where the list was not scrolling properly.	30
Week #4	• Built basic appointment booking forms and doctor availability lists using Cubit for state. • Fixed data refresh and UI alignment bugs found in testing. • Participated in architecture meetings and noted migration requirements.	30

Week #5	- Helped sketch a cleaner database layout (ERD) to reduce redundant fields. - Implemented simple pagination for doctor lists to improve load experience. - Build the UI screens for user and doctor management based - Integrated the UI with the new Appwrite backend for read-only operations.	30
Week #6	- Researched and implemented a RouteAware mixin on key screens to trigger data refreshes only when the user navigates to that screen, improving performance. - Fixed navigation issues in the doctor's profile flow.	30
Week #7	- Identified and fixed a performance issue where the entire list of doctors was being rebuilt unnecessarily. Optimized the DoctorCard widget. - Added a loading indicator to the all_doctors list to improve user feedback during data fetch.	30
Week #8	- Tasked with beginning the restructuring of the Appointment History and Prescription History folders to match the project's standardized feature structure (screens/, cubit/, repository/). - This involved moving files, updating import paths, and ensuring the code compiled without errors.	30
Week #9	- Reorganized the project into the agreed folder layout . - Built a small shared UI component library (buttons, inputs) and updated screens to use it. - Refactored data calls into simple repository classes to avoid calling APIs directly from UI code.	30
Week #10	- Moved Appointment History and Prescription History into features/appointments/ and features/prescriptions/and fixed imports. - Made base state classes aware of the root context and added a simple “pop back” helper for nested navigation. - Tested the modules end-to-end and corrected minor model/import mismatches. - Polished Doctor Panel UX with basic validation and loaders.	30

Week #11	• Reviewed Cubit/state patterns across features and made them consistent (one-cubit-per-feature). • Performed integration tests across patient, doctor, and admin apps; fixed synchronization issues found. • Added simple caching for doctor availability to reduce repeated requests.	30
Week #12	• Finalized and cleaned up the refactor: ensured features/appointments/ and features/prescriptions/ compiled cleanly after moves and import updates. • Shared final progress update with mentor and ensured my code handover was already reflected in the repo through ongoing commits.	30
